

# Module 11: Writing DataWeave transformations

1

## Goal

- You have been using DataWeave throughout class
  - To write inline expressions to dynamically set the value of properties in event processors
  - To transform data – this was mostly generated by the graphical drag-and-drop editor so far
- In this module, you
  - Learn to write DataWeave transformations from scratch
  - Get familiar with the language so you can write more complicated transformations that are not possible with the drag-and-drop GUI

2

## Goal

Output Payload ▾

```

1@ %dw 2.0
2  output application/dw
3  import dasherize from dw::core::Strings
4  type Currency = String {format: '###.00'}
5  type Flight = Object {class: "com.mulesoft.training.Flight"}
6  //var numSeats = 400
7  //var numSeats = (x=400) -> x
8  /*var numSeats = (planeType: String) ->
9     if (planeType contains('737'))
10        150
11    else
12        300
13  */
14@ fun getNumSeats(planeType: String) = do {
15@   var maxSeats =
16@     if (planeType contains('737'))
17@       150
18@     else
19@       300
20@   ---
21@   maxSeats
22@ }
23 ---
24@ flights: (payload.*return map (object, index) -> {
25@   destination: object.destination,
26@   price: object.price as Number as Currency,
27@   // totalSeats: getNumSeats(object.planeType as String),
28@   planeType: dasherize(replace(object.planeType,/(Boing)/) with "Boeing"),
29@   departureDate: object.departureDate as Date {format: "yyyy/MM/dd"}
30@   as String {format: "MMM dd, yyyy"},
31@   availableSeats: object.emptySeats as Number
32@ } as Flight) distinctBy $ filter ($.availableSeats !=0)
33   orderBy $.departureDate orderBy $.price

```

```

{
  flights: [
    {
      destination: "LAX",
      price: "199.99" as String {format: "###.00"},
      planeType: "boeing-737",
      departureDate: "Oct 21, 2015" as String {format: "MMM dd, yyyy"},
      availableSeats: 10
    } as Object {class: "com.mulesoft.training.Flight"},
    {
      destination: "PDX",
      price: "283.00" as String {format: "###.00"},
      planeType: "boeing-777",
      departureDate: "Oct 20, 2015" as String {format: "MMM dd, yyyy"},
      availableSeats: 23
    } as Object {class: "com.mulesoft.training.Flight"},
    {
      destination: "PDX",
      price: "283.00" as String {format: "###.00"},
      planeType: "boeing-777",
      departureDate: "Oct 21, 2015" as String {format: "MMM dd, yyyy"},
      availableSeats: 30
    } as Object {class: "com.mulesoft.training.Flight"},
    {
      destination: "SFO",
      price: "400.00" as String {format: "###.00"},
      planeType: "boeing-737",
      departureDate: "Oct 20, 2015" as String {format: "MMM dd, yyyy"},
      availableSeats: 40
    } as Object {class: "com.mulesoft.training.Flight"}
  ]
}

```

3

## At the end of this module, you should be able to

- Write DataWeave expressions for basic XML, JSON, and Java transformations
- Write DataWeave transformations for complex data structures with repeated elements
- Define and use global and local variables
- Define and use DataWeave functions
- Coerce and format strings, numbers, and dates
- Define and use custom data types
- Call Mule flows from DataWeave expressions
- Store DataWeave scripts in external files

All contents © MuleSoft Inc.

4

# Creating transformations with the Transform Message component

5

## Creating transformations with the Transform Message component

- To now, you have used the Transform Message component to
  - Create transformations using the visual editor
  - Define metadata for the input and output payload
  - Write basic transformation expressions
- But...
  - Where does the code go?
  - Can you save the code externally and reuse it?
  - What happens when you create sample data for live preview?
  - Does the target of a transformation have to be the payload?

6

## Where is the DataWeave code?

- By default, the expression is placed inline in the Mule configuration file

```
<flow doc:id="a2d732ff-aaec-448e-9bdd-a25319cc55a2" name="postFlight">
  <ee:transform doc:name="Transform Message" doc:id="ccda7d44-19b9">
    <ee:message>
      <ee:set-payload><![CDATA[%dw 2.0
output application/java
---
payload]]></ee:set-payload>
    </ee:message>
    <ee:variables>
      <ee:set-variable variableName="DWOutput"><![CDATA[%dw 2.0
output application/json
---
payload]]></ee:set-variable>
    </ee:variables>
  </ee:transform>
  <logger level="INFO" doc:name="Logger" doc:id="6b956315-38e9-421">
</flow>
```

- Sample data used for live preview is stored in src/test/resources

```
▼ src/test/resources
  {} flight-example.json
  {} flights-example.json
  [X] flights-example.xml
  [X] log4j2-test.xml
  {} united-flights-example.json
▼ sample_data
  {} design-info.json
  {} json.json
```

All contents © MuleSoft Inc.

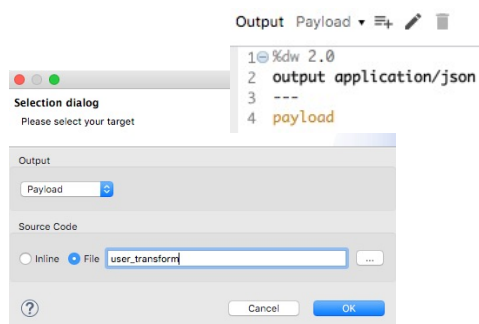

7

7

## Exporting DataWeave code to a DWL file

- In the Transform Message component, click the Edit current target button and set source code to file
  - Transform is saved in a DWL file
  - DWL files are stored in src/main/resources

```
<ee:transform doc:name="Transform Message" doc:id="69db8t">
  <ee:message>
    <ee:set-payload resource="user_transform.dwl" />
  </ee:message>
</ee:transform>
```

```
▼ src/main/resources
  [X] log4j2.xml
  {} user_transform.dwl
  api
```

All contents © MuleSoft Inc.

8

8

## Reusing DataWeave code

- A single script can be stored in an **external DWL file** and referenced
  - In the Transform Message component using the resource attribute
  - In an element that has an expression property (like the Choice router) using the `${file::filename}` syntax
- You can also create **modules** (libraries) of reusable DataWeave functions

```
<ee:transform doc:name="Transform Message" doc:id="69db8t"
  <ee:message>
    <ee:set-payload resource="user_transform.dwl" />
  </ee:message>
</ee:transform>
```

All contents © MuleSoft Inc.

9

9

## Creating multiple transformations

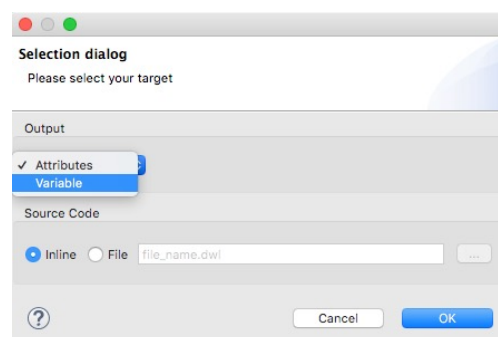

- You can also create multiple transformations with one Transform Message component

(1) Use Add new target button

(3) Switch between multiple transformations

(2) Set where to store result

All contents © MuleSoft Inc.

10

10

## Walkthrough 11-1: Create transformations with the Transform Message component

- Create a new flow that receives POST requests of JSON flight objects
- Customize propagated metadata
- Add sample data and use live preview
- Create a second transformation that stores the output in a variable
- Save a DataWeave script in an external file
- Review DataWeave script errors

All contents © MuleSoft Inc.

11

11

## Writing DataWeave transformation expressions

12

## The DataWeave expression is a data model for the output

- It is not dependent upon the types of the input and output, just their structures
- It's against this model that the transform executes
- The data model of the produced output can consist of three different types of data
  - **Objects**: Represented as collection of key value pairs
  - **Arrays**: Represented as a sequence of comma separated values
  - **Simple literals**

All contents © MuleSoft Inc.

13

13

## Example DataWeave transformation expression

The **header** contains directives that apply to the body expression

Input	Transform	Output
<pre>{   "firstname": "Max",   "lastname": "Mule" }</pre>	<pre>%dw 2.0 output application/xml --- {   user: {     fname: payload.firstname,     lname: payload.lastname   } }</pre>	<pre>&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;user&gt;   &lt;fname&gt;Max&lt;/fname&gt;   &lt;lname&gt;Mule&lt;/lname&gt; &lt;/user&gt;</pre>

Delimiter to separate header and body

The **body** contains a DataWeave expression that generates the output structure

All contents © MuleSoft Inc.

14

14

## The output directive

- Specifies the mime type (format) that the script outputs

Some we have used or seen	application/json application/java application/xml text/plain
Others we will use	<b>application/dw</b> (DataWeave – for testing DataWeave expressions) application/csv
Others	application/xlsx application/flatfile (Flat File, Cobol Copybook, Fixed Width) multipart/* application/octet-stream, application/x-www-form-urlencoded

All contents © MuleSoft Inc.

15

15

## Two types of DataWeave errors

- Scripting errors
  - A problem with the syntax
- Formatting errors
  - A problem with how the transformation from one format to another is written
  - For example, a script to output XML that does not specify a data structure with a single root node
- If you get an error, transform the input to **application/dw**
  - If the transformation is successful, then the error is likely a formatting error

All contents © MuleSoft Inc.

16

16

## Including comments in DataWeave expressions

- Comments that use a Java-like syntax can be used

```
// My single-line comment here
```

```
/** My multi-line  
comment here. */
```

All contents © MuleSoft Inc.

17

17

## Transforming basic data structures

18

## Writing expressions for JSON or Java input and output

- The data model can consist of three different types of data: objects, arrays, simple literals

Input	Transform	JSON output
<pre>{   "firstname": "Max",   "lastname": "Mule" }</pre>	fname: payload.firstname	{"fname": "Max"}
	{fname: payload.firstname}	{"fname": "Max"}
	<pre>user: {   fname: payload.firstname,   lname: payload.lastname,   num: 1 }</pre>	<pre>{"user": {   "fname": "Max",   "lname": "Mule",   "num": 1 }}</pre>
	<pre>[   {fname: payload.firstname, num: 1},   {lname: payload.lastname, num: 2} ]</pre>	<pre>[   {"fname": "Max", "num": 1},   {"lname": "Mule", "num": 2} ]</pre>

All contents © MuleSoft Inc.

19

19

## Writing expressions for XML output

- XML can only have one top-level value and that value must be an object with one property

- This will throw an exception

Output Payload 2 issues found

```
1 @ %dw 2.0
2   output application/xml
3   ---
4   {
5     fname: payload.firstname,
6     lname: payload.lastname
7   }
```

- This will work

All contents © MuleSoft Inc.

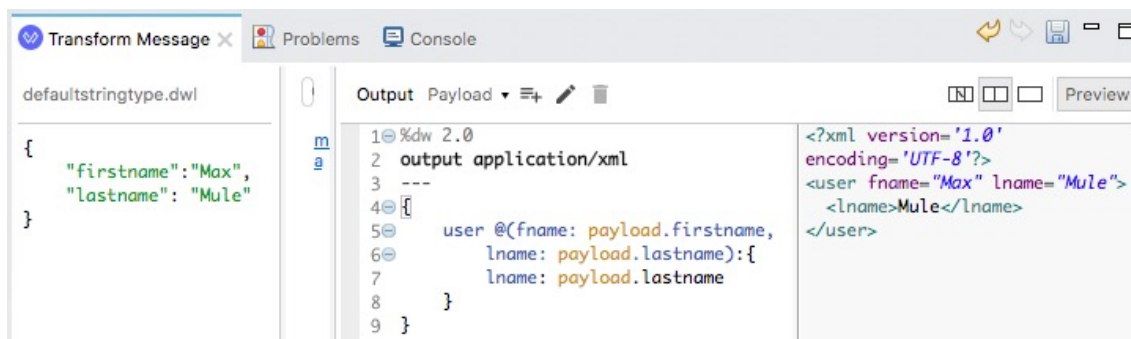

20

20

## Specifying attributes for XML output

- Use @(attName: attValue) to create an attribute

All contents © MuleSoft Inc.

21

21

## Writing expressions for XML input

- By default, only XML elements and not attributes are created as JSON fields or Java object properties
- Use @ to reference attributes

Input	Transform	JSON output
<pre>&lt;user firstname="Max"&gt;   &lt;lastname&gt;Mule&lt;/lastname&gt; &lt;/user&gt;</pre>	payload	<pre>{ "user": {   "lastname": "Mule" } }</pre>
	payload.user	<pre>{"lastname": "Mule" }</pre>
	<pre>{   fname: payload.user.@firstname,   lname: payload.user.lastname }</pre>	<pre>{"fname": "Max",  "lname": "Mule" }</pre>

All contents © MuleSoft Inc.

22

22

## Walkthrough 11-2: Transform basic JSON, Java, and XML data structures

- Write scripts to transform the JSON payload to various JSON and Java structures
- Write scripts to transform the JSON payload to various XML structures

The screenshot shows the MuleSoft IDE interface. On the left, a script is written in a text editor with line numbers 1 through 9. The script sets the output to application/xml and defines a data structure with a hub and a flight. On the right, a preview window shows the resulting XML output.

```

1 @dw 2.0
2 output application/xml
3 ---
4 data: {
5   hub: "MUA",
6   flight @(airline: payload.airline): {
7     code: payload.toAirportCode,
8   }
9 }
  
```

```

<?xml version='1.0' encoding='UTF-8'?>
<data>
  <hub>MUA</hub>
  <flight airline="United">
    <code>SFO</code>
  </flight>
</data>
  
```

All contents © MuleSoft Inc.

23

23

## Transforming complex data structures with arrays

24

## Working with collections

- Use the **map** function to apply a transformation to each element in an array
  - The input array can be JSON or Java
  - Returns an array of elements

The transformation function (or lambda) to apply to each element

A **lambda** is an anonymous function not bound to an identifier

All contents © MuleSoft Inc.

25

25

## The transformation function (or lambda)

- Inside the transformation function
  - \$\$ refers to the index (or key)
  - \$ refers to the value

Input	Transform	Output
<pre>[   {"firstname": "Max",    "lastname": "Mule"},   {"firstname": "Molly",    "lastname": "Mule"} ]</pre>	<pre>%dw 2.0 output application/json --- payload map {   num: \$\$,   fname: \$.firstname,   lname: \$.lastname }</pre>	<pre>[   {"num": 0,    "fname": "Max",    "lname": "Mule"},   {"num": 1,    "fname": "Molly",    "lname": "Mule"} ]</pre>
	<pre>%dw 2.0 %output application/json --- users: payload map {   user: {     fname: \$.firstname,     lname: \$.lastname   } }</pre>	<pre>{   "users": [     { "user": {       "fname": "Max",       "lname": "Mule"     } },     { "user": {       "fname": "Molly",       "lname": "Mule"     } }   ] }</pre>

All contents © MuleSoft Inc.

26

26

## Use explicit arguments in lambdas for more readable code

Input	Transform	Output
<pre>[   {"firstname": "Max",    "lastname": "Mule"},   {"firstname": "Molly",    "lastname": "Mule"} ]</pre>	<pre>%dw 2.0 output application/json --- payload map (object, index) -&gt; {   num: index,   fname: object.firstname,   lname: object.lastname }</pre>	<pre>[   {"num": 0,    "fname": "Max",    "lname": "Mule"},   {"num": 1,    "fname": "Molly",    "lname": "Mule"} ]</pre>
	<pre>%dw 2.0 %output application/json --- users: payload map (object, index) -&gt; {   user: {     fname: object.firstname,     lname: object.lastname   } }</pre>	<pre>{   "users": [     {       "user": {         "fname": "Max",         "lname": "Mule"       }     },     {       "user": {         "fname": "Molly",         "lname": "Mule"       }     }   ] }</pre>

All contents © MuleSoft Inc.

27

27

## Walkthrough 11-3: Transform complex data structures with arrays

- Create a new flow that receives POST requests of a JSON array of flight objects
- Transform a JSON array of objects to DataWeave, JSON, and Java

Output Payload

```

1 %dw 2.0
2   output application/java
3   ---
4   payload map (object, index) -> {
5     'flight$(index)': object
6   }

```

Q Loading Data ...

▼ Array

▼ [0]: Object

▼ flight0: Object

airline: String = "United"

flightCode: String = "ER38sd"

fromAirportCode: String = "LAX"

toAirportCode: String = "SFO"

departureDate: String = "May 21, 2016"

emptySeats: Number = 0

totalSeats: Number = 200

price: Number = 199

planeType: String = "Boeing 737"

28

28

# Transforming complex XML data structures

29

## Writing expressions for XML output

- When mapping array elements (JSON or JAVA) to XML, wrap the map function in `{( ... )}`
  - `{}` are defining the object
  - `()` are transforming each element in the array as a key/value pair

Input	Transform	Output
<pre>[   {"firstname": "Max",    "lastname": "Mule"},   {"firstname": "Molly",    "lastname": "Mule"} ]</pre>	<pre>%dw 2.0 output application/xml --- users: payload map (object, index) -&gt; {   fname: object.firstname,   lname: object.lastname }</pre>	Cannot coerce an array to an object
	<pre>users: {(payload map (object, index) -&gt; {   fname: object.firstname,   lname: object.lastname })}</pre>	<pre>&lt;users&gt;   &lt;fname&gt;Max&lt;/fname&gt;   &lt;lname&gt;Mule&lt;/lname&gt;   &lt;fname&gt;Molly&lt;/fname&gt;   &lt;lname&gt;Mule&lt;/lname&gt; &lt;/users&gt;</pre>

All contents © MuleSoft Inc.

30

30

## Writing expressions for XML output (cont)

Input	Transform	Output
<pre>[   {"firstname":"Max",    "lastname":"Mule"},   {"firstname":"Molly",    "lastname":"Mule"} ]</pre>	<pre>users: {(payload map (object, index) -&gt; {   fname: object.firstname,   lname: object.lastname })}</pre>	<pre>&lt;users&gt;   &lt;fname&gt;Max&lt;/fname&gt;   &lt;lname&gt;Mule&lt;/lname&gt;   &lt;fname&gt;Molly&lt;/fname&gt;   &lt;lname&gt;Mule&lt;/lname&gt; &lt;/users&gt;</pre>
	<pre>users: {( payload map (object, index) -&gt; {   user: {     fname: object.firstname,     lname: object.lastname   } })}</pre>	<pre>&lt;users&gt;   &lt;user&gt;     &lt;fname&gt;Max&lt;/fname&gt;     &lt;lname&gt;Mule&lt;/lname&gt;   &lt;/user&gt;   &lt;user&gt;     &lt;fname&gt;Molly&lt;/fname&gt;     &lt;lname&gt;Mule&lt;/lname&gt;   &lt;/user&gt; &lt;/users&gt;</pre>

All contents © MuleSoft Inc.

31

31

## Writing expressions for XML input

- Use .\* selector to reference repeated elements

Input	Transform	JSON output
<pre>&lt;users&gt;   &lt;user firstname="Max"&gt;     &lt;lastname&gt;Mule&lt;/lastname&gt;   &lt;/user&gt;   &lt;user firstname="Molly"&gt;     &lt;lastname&gt;Jennet&lt;/lastname&gt;   &lt;/user&gt; &lt;/users&gt;</pre>	payload	<pre>{ "users":   { "user": { "lastname": "Mule" },     "user": { "lastname": "Jennet" }   } }</pre>
	payload.users	<pre>{ { "user": { "lastname": "Mule" },   "user": { "lastname": "Jennet" } }</pre>
	payload.users.user	<pre>{ "lastname": "Mule" }</pre>
	payload.users.*user	<pre>[   { "lastname": "Mule" },   { "lastname": "Jennet" } ]</pre>
	<pre>payload.users.*user map (obj,index) -&gt; {   fname: obj.@firstname,   lname: obj.lastname }</pre>	<pre>[   { "fname": "Max", "lname": "Mule" },   { "fname": "Molly", "lname": "Jennet" } ]</pre>

All contents © MuleSoft Inc.

32

32

## Beware of tools that “prettify” responses

- In some tools (like Postman), make sure you look at the raw response and not the pretty response

Input	Transform
<pre>&lt;users&gt; &lt;user firstname="Max"&gt;   &lt;lastname&gt;Mule&lt;/lastname&gt; &lt;/user&gt; &lt;user firstname="Molly"&gt;   &lt;lastname&gt;Jennet&lt;/lastname&gt; &lt;/user&gt; &lt;/users&gt;</pre>	<pre>%dw 2.0 output application/json --- payload</pre>

All contents © MuleSoft Inc.

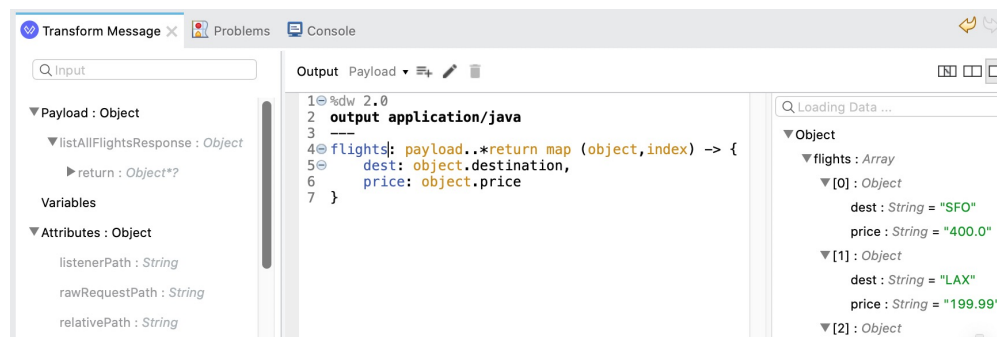

33

33

## Walkthrough 11-4: Transform to and from XML with repeated elements

- Transform a JSON array of objects to XML
- Replace sample data associated with a transformation
- Transform XML with repeated elements to different data types

All contents © MuleSoft Inc.

34

34

# Defining and using variables and functions

35

## Defining and using global variables

- Use the **var** directive in the header
- Assign it a constant or a lambda expression
  - DataWeave is a functional programming language where variables behave just like functions
- Global variables can be referenced anywhere in the body

Input	Transform	Output
<pre>{ "firstname": "Max",   "lastname": "Mule" }</pre>	<pre>%dw 2.0 output application/xml var mname = "the" var mname2 = () -&gt; "other" var lname = (aString) -&gt; upper(aString) --- name: {   first: payload.firstname,   middle1: mname, middle2: mname2(),   last: lname(payload.lastname) }</pre>	<pre>&lt;name&gt;   &lt;first&gt;Max&lt;/first&gt;   &lt;middle1&gt;the&lt;/middle1&gt;   &lt;middle2&gt;other&lt;/middle2&gt;   &lt;last&gt;MULE&lt;/last&gt; &lt;/name&gt;</pre>

All contents © MuleSoft Inc.

36

36

## Defining and using variables in a syntax similar to traditional functions

- DataWeave includes an alternate syntax to access lambda expressions assigned to a variable as functions
  - May be more clear or easier to read for some people

Input	Transform	Output
{ "firstname": "Max", "lastname": "Mule" }	<pre>%dw 2.0 output application/xml var lname = (aString) -&gt; upper(aString) --- name: {   first: payload.firstname,   last: lname(payload.lastname) }</pre>	<pre>&lt;name&gt;   &lt;first&gt;Max&lt;/first&gt;   &lt;last&gt;MULE&lt;/last&gt; &lt;/name&gt;</pre>
	<pre>%dw 2.0 output application/xml fun lname(aString) = upper(aString) --- name: {   first: payload.firstname,   last: lname(payload.lastname) }</pre>	

All contents © MuleSoft Inc.

37

37

## Defining and using local variables

- Use the **do** keyword with the syntax  
do {<variable declaration header> --- <body>}
- Local variables can only be referenced from within the scope of the expression where they are initialized

Input	Transform	Output
{ "firstname": "Max", "lastname": "Mule" }	<pre>do { var name = payload.firstname ++ " " ++     payload.lastname --- name }</pre>	"Max Mule"
	<pre>do { var fname = payload.firstname var lname = payload.lastname ---   { person:     do { var user = fname var color = "gray" ---       { name1: user, color: color }     },     name2: lname } }</pre>	<pre>{   "person": {     "name1": "Max",     "color": "gray"   },   "name2": "Mule" }</pre>
	<pre>do { var fname = payload.firstname var lname = payload.lastname ---   { person:     do { var user = fname var color = "gray" ---       { name1: user, color: color }     },     name2: lname, color: color } }</pre>	Unable to resolve reference of color

All contents © MuleSoft Inc.

38

38

## Walkthrough 11-5: Define and use variables and functions

- Define and use a global constant
- Define and use a global variable that is equal to a lambda expression
- Define and use a lambda expression assigned to a variable as a function
- Define and use a local variable

```

Output Payload
10 300
11 */
12 fun getNumSeats(planeType: String) = do {
13   var maxSeats =
14     if (planeType contains('737'))
15       150
16     else
17       300
18   maxSeats
19 }
20
21
22 flights: payload.*return map (object, index) -> {
23   dest: object.destination,
24   price: object.price,
25   totalSeats: getNumSeats(object.planeType as String),
26   plane: object.planeType
27 }
  
```

```

{ flights: [
  {
    dest: "SFO",
    price: "400.0",
    totalSeats: 150,
    plane: "Boeing 737"
  },
  {
    dest: "LAX",
    price: "199.99",
    totalSeats: 150,
    plane: "Boeing 737"
  },
  {
    dest: "PDX",
    price: "285.0",
    totalSeats: 300,
    plane: "Boeing 777"
  }
]
  
```

All contents © MuleSoft Inc.

39

39

## Formatting and coercing data

40

## Using the as operator for type coercion

```
price: payload.price as Number
```

```
price: $.price as Number {class:"java.lang.Double"}
```

- Defined types include
  - Any (the top-level type)
  - Null, String, Number, Boolean
  - Object, Array, Range
  - Date, Time, LocalTime, DateTime, LocalDateTime, TimeZone, Period
  - More...

## Using format patterns

- Use the metadata **format** schema property to format numbers and dates

```
price as Number as String {format: "###.00"},
```

```
someDate as DateTime {format: "yyyyMMddHHmm"}
```

- For formatting patterns, see
  - <https://docs.oracle.com/javase/8/docs/api/java/text/DecimalFormat.html>
  - <https://docs.oracle.com/javase/8/docs/api/java/time/format/DateTimeFormatter.html>

42

## Walkthrough 11-6: Coerce and format strings, numbers, and dates

- Coerce data types
- Format strings, numbers, and dates

```

19     maxSeats
20 }
21 ---
22 @flights: payload.*return map (object, index) -> {
23   dest: object.destination,
24   price: object.price as Number as String {format: '###.00'},
25   totalSeats: getNumSeats(object.planeType as String),
26   plane: upper(object.planeType as String),
27   date: object.departureDate as Date {format: "yyyy/MM/dd"}
28       as String {format: "MMM dd, yyyy"}
29 }

```

```

totalSeats: 150,
plane: "BOING 737",
date: "Oct 20, 2015" as String {format: "MMM dd, yyyy"}
},
{
  dest: "LAX",
  price: "199.99" as String {format: "###.00"},
  totalSeats: 150,
  plane: "BOING 737",
  date: "Oct 21, 2015" as String {format: "MMM dd, yyyy"}
},
{
  dest: "PNY"

```

43

43

## Using custom data types

44

## Defining and using custom data types

- Use the **type** header directive
  - Recommended to lead with an uppercase letter
    - No special characters

```
%dw 2.0
output application/json
type Ourdateformat = DateTime {format: "yyyyMMddHHmm"}
---
someDate: payload.departureDate as Ourdateformat
```

All contents © MuleSoft Inc.

45

45

## Transforming objects to POJOs

- Specify inline

```
customer:payload.User as Object {class: "my.company.User"}
```

- Or define a custom data type to use

```
type User = Object {class: "my.company.User"}
---
customer:payload.User as User
```

All contents © MuleSoft Inc.

46

46

## Walkthrough 11-7: Define and use custom data types

- Define and use custom data types
- Transform objects to POJOs

Output Payload ▾ ⚙️ 🗑️

```

16      150
17      else
18      300
19      ---
20      maxSeats
21  }
22  ---
23  flights: payload..*return map (object, index) -> {
24    destination: object.destination,
25    price: object.price as Number as Currency,
26    // totalSeats: getNumSeats(object.planeType as String),
27    planeType: upper(object.planeType as String),
28    departureDate: object.departureDate as Date {format:
29      as String {format: "MMM dd, yyyy"}}
30  } as Flight

```

Q Loading Data ...

▼ Object

▼ flights : Array

▼ [0] : Object

```

flightCode : Null = null
availableSeats : Number = 0
destination : String = "SFO"
planeType : String = "BOING 737"
price : Number = 400.0
origin : Null = null
departureDate : String = "Oct 20, 2015"
airlineName : Null = null

```

▼ [1] : Object

```

flightCode : Null = null

```

## Using DataWeave functions

48

## Review: Using DataWeave functions

- Functions are packaged in modules
- Functions in the Core module are imported automatically into DataWeave scripts
- For function reference, see
  - <https://docs.mulesoft.com/mule-runtime/4.3/dw-functions>
- For functions with 2 parameters, an alternate syntax can be used
 

```
#[contains(payload, "max")]
#[payload contains "max"]
```

All contents © MuleSoft Inc.

▼ DataWeave Function Reference

▼ Core (dw::Core)	groupBy	maxBy	scan
++	isBlank	min	sizeOf
--	isDecimal	minBy	splitBy
abs	isEmpty	mod	sqrt
avg	isEven	native	startsWith
ceil	isInteger	now	sum
contains	isLeapYear	orderBy	to
daysBetween	isOdd	pluck	trim
distinctBy	joinBy	pow	typeof
endsWith	log	random	unzip
filter	lower	randomInt	upper
filterObject	map	read	uuid
find	mapObject	readUrl	with
flatMap	match	reduce	write
flatten	matches	replace	zip
floor	max	round	49

49

## Calling functions that have a lambda expression as a parameter

- The alternate notation can make calling functions that have a lambda expression as a parameter easier to read
 

```
sizeOf(filter(payload, (value) -> value.age > 30))
sizeOf(payload filter $.age > 30)
```
- When using a series of functions, the first function in the chain is executed first: filter then orderBy then groupBy
 

```
flights filter ($.availableSeats > 30) orderBy $.price groupBy $.toAirport
```

All contents © MuleSoft Inc.

50

50

## Using DataWeave functions not in the Core module

- Functions in all other modules must be imported
- Import a function in a module

```
%dw 2.0
output application/xml
import dasherize from dw::core::Strings
---
n: upper(dasherize(payload.firstname ++
payload.lastname))
```

- Import a module

```
%dw 2.0
output application/xml
import dw::core::Strings
---
n: upper(Strings::dasherize(payload.firstname ++
payload.lastname))
```

## Walkthrough 11-8: Use DataWeave functions

- Use functions in the Core module that are imported automatically
- Replace data values using pattern matching
- Order data, remove duplicate data, and filter data
- Use a function in another module that you must explicitly import into a script to use
- Dasherize data

```
distinctBy $ filter ($.availableSeats !=0)
orderBy $.departureDate orderBy $.price
```

# Looking up data by calling a flow

53

## Calling flows from a DataWeave expression

- Use the **lookup** function

```
{a: lookup("myFlow",{b:"Hello"}) }
```

- The first argument is the name of the flow to be called
  - Cannot call subflows
- The second argument is the payload to send to the flow as a map
- Whatever payload the flow returns is what the expression returns

54

## Walkthrough 11-9: Look up data by calling a flow

- Call a flow from a DataWeave expression

```
totalSeats: lookup("getTotalSeats",{planeType: object.planeType}),
```

All contents © MuleSoft Inc.

55

55

## Summary

56

## Summary

- DataWeave code can be inline, in a DWL file, or in a module of functions
- The **data model** for a transformation can consist of three different types of data: objects, arrays, and simple literals
- **Many formats** can be used as input and output including JSON, Java, XML, CSV, Excel, Flat File, Cobol Copybook, Fixed Width, and more
- The DataWeave **application/dw** format can be used to test expressions to ensure there are no scripting errors
- Use the **map** function to apply a transformation function (a lambda) to each item in an array
- A **lambda** is an anonymous function not bound to an identifier
- When mapping array elements (JSON or JAVA) to XML, wrap the map function in `{{ ... }}`

All contents © MuleSoft Inc.

57

57

## Summary

- DataWeave is a functional programming language where variables behave just like functions
- Define global variables in the header with **var**
  - Assign them a constant or a lambda expression
  - Use **fun** directive to access lambdas assigned to variables as traditional functions
- Define local variables in the body with **do{}**
  - The scope of the do statement defines the boundaries of local variables
- Functions are packaged in modules
  - Functions in the Core module are imported automatically into DataWeave scripts
  - Use the **import** header directive to import functions in all other modules
- Functions with 2 parameters can be called with 2 different syntax

All contents © MuleSoft Inc.

58

58

## Summary

- Use the metadata **format** schema property to format #'s and dates
- Use the **type** header directive to specify custom data types
- Transform objects to POJOs using: as Object {class: "com.myPOJO"}
- Use **lookup()** to get data by calling other flows
